

1. For harder question, model tends to reflect more: The easy questions have an average reflection rate of 25.8% and the hard questions are 37.5%.
2. Within each category, the correctness rate is not correlated with reflection rate, excluding some outliers due to rare samples. This hints reflection of models might be redundant.
3. After intervention, reflection rates of all categories are reduced, while harder questions still get more reflections.

D LLM usage

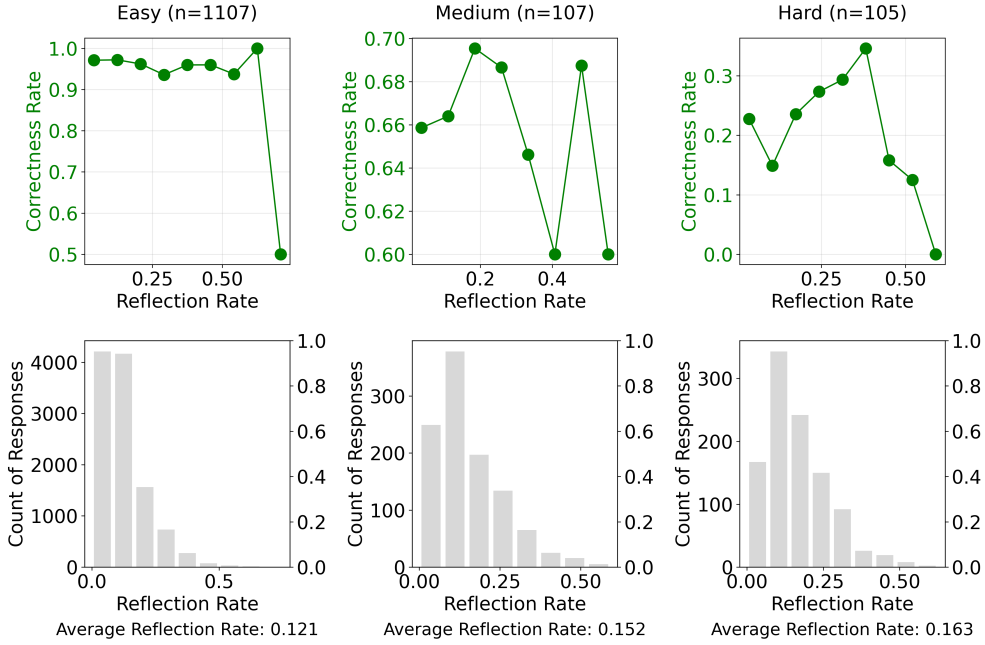

In the writing of this paper, LLMs are utilized to check grammar errors and typos as well as improving general writing.

E Computational resources

The main experiments is conducted on 8 NVIDIA 6000 ada gpus for around 200 hours.

(a) Base model. Top: Correctness rate vs. reflection rate. Bottom: Reflection rate distribution.

(b) Intervention. Top: Correctness rate vs. reflection rate. Bottom: Reflection rate distribution.

Figure 9: Correctness rate and reflection rate on three categories of questions for DeepSeek-R1 llama 8b model on GSM8k dataset.
